Streamline®

XHP COPPER-IRON TUBE & FITTINGS

COPPER-IRON TUBE IDENTIFICATION METHOD

Standard copper tube does not contain iron and will not react to a magnet. Copper-iron tubing like Streamline XHP contains roughly 2.5% iron content, meaning it will show some attraction to a good magnet. Because the visual difference between the copper alloys is not visually obvious, magnets provide a dependable method for material identification. While any magnet can be used, rare earth magnets are strongly recommended to ensure a response to the low amount of iron present.

WHY USE A RARE EARTH MAGNET?

STRONGER MAGNETIC PULL

Easier identification of the Streamline XHP tube and fittings.

IMPROVED ACCURACY

Reduces confusionbetween standard copper tube and copper-iron tube.

IDENTIFICATION BENEFITS

FASTER VERIFICATION

Speeds up receiving, production, inventory, and job site inspections.

CONSISTENT PERFORMANCE

Provides reliableresultseventhrough dirt, coatings, or surface oxidation.
